

Technical Interview Results

Candidate: Candidate

Date: 2025-05-03 18:47

Summary

Overall Score: 0.0/100

Rating: Needs Improvement

Skills

Programming

java, python, sql, css, javascript, html

Frameworks

react

Databases

sql

Cloud

azure

Questions and Evaluations

Question 1: Explain the concept of closures in JavaScript.

Answer: Question 1: Explain the concept of closures in JavaScript.

Score: 0/100

Feedback: The answer is completely inadequate. It simply repeats the question. A good answer should explain what a closure is, why they are useful, and provide a code example demonstrating the concept. The explanation should cover the fact that a closure allows inner functions to access and 'remember' variables from their surrounding lexical environment (even after that environment

has finished executing).

Missing concepts:

- closure
- lexical environment
- variable scope
- example code

Question 2: What is the purpose of the semantic elements in HTML5?

Answer: idk

Score: 0/100

Feedback: The answer 'idk' indicates a complete lack of understanding of semantic HTML elements.

This is a fundamental concept in web development. The question requires an explanation of how semantic elements improve code readability, accessibility, and SEO. No understanding of these core benefits was demonstrated.

Missing concepts:

- semantic HTML
- accessibility
- SEO (Search Engine Optimization)
- readability
- code maintainability
- examples of semantic elements (e.g., <article>, <aside>, <nav>, <header>, <footer>, <main>)

Question 3: How do you handle asynchronous operations in JavaScript?

Answer: no

Score: 0/100

Feedback: The answer 'no' does not demonstrate any understanding of asynchronous operations in JavaScript. The candidate needs to explain concepts and provide examples of how they handle

asynchronous operations. A good answer would include discussion of Promises, async/await, callbacks, and potentially event loops or the differences between synchronous and asynchronous programming.

Missing concepts:

- Promises
- async/await
- Callbacks
- Event Loop
- Asynchronous vs. Synchronous Programming

Question 4: What is your process for estimating project timelines?

Answer: no

Score: 0/100

Feedback: The answer 'no' is insufficient. A good answer would describe a process for estimating project timelines, including factors considered (e.g., task breakdown, dependencies, risk assessment, historical data, team expertise, buffer time), methodologies used (e.g., three-point estimation, PERT, Agile methodologies), and tools employed (e.g., spreadsheets, project management software). The candidate needs to demonstrate understanding of estimation techniques and their application in a real-world project setting.

Missing concepts:

- task breakdown
- dependency analysis
- risk assessment
- estimation techniques (e.g., three-point estimation, PERT)
- buffer time
- historical data
- team expertise

- project management software
- methodologies (e.g., Agile, Waterfall)
- Contingency planning

Question 5: How do you create a responsive image in HTML?

Answer: `<img> <?img>`

Score: 0/100

Feedback: The answer provided is completely incorrect. The provided code `<img> <?img>` is not valid HTML and doesn't demonstrate any understanding of responsive images. A responsive image requires using the `<picture>` element or the `srcset` and `sizes` attributes of the `<img>` element to provide different image sizes for different screen resolutions. The answer shows no knowledge of these techniques.

Missing concepts:

- `<picture>` element
- `srcset` attribute
- `sizes` attribute
- responsive image techniques
- valid HTML syntax
